

APPENDIX D

DELTA

The Delta launch vehicle configuration is specified by a four digit number designating the configuration of the launch vehicle stages. For other than the standard payload fairing, the designation of the fairing is added to the end of the number. The current designators are as follows:

1st digit - Type of augmentation/ first stage:

- 2 - Castor II augmentation, extended long tank, RS-27 engine.
- 3 - Castor IV augmentation, extended long tank, RS-27 engine.
- 4 - Castor IVA augmentation, extended long tank, MB-3 engine.
- 5 - Castor IVA augmentation, extended long tank, RS-27 engine.
- 6 - Castor IVA augmentation, extra extended long tank, RS-27 engine.
- 7 - GEM solid motors augmentation, extra extended long tank, modified RS-27 engine.

2nd digit - Quantity of augmentation motors:

- 3 - Three motors.
- 9 - Nine motors.

3rd digit - Type of second stage:

- 1 - Standard second stage [4536 Kg (10,000 lb) propellant, TRW TR-201 engine].
- 2 - Uprated second stage [5987 Kg (13,200 lb) propellant, AJC ITIP engine].

4th digit - Type of third stage:

- 0 - No third stage.
- 3 - TE-364-3 third stage [653 Kg (1,440 lb) propellant].
- 4 - TE-364-4 third stage [1043 Kg (2,300 lb) propellant].
- 5 - PAM-D third stage [2009 Kg (4,430 lb) propellant max.].

Payload fairing size is designated as:

- None - Standard fairing [2.9 m (9.5 ft)].
- 8 - 2.4 m (8 ft) diameter fairing.
- 10 - 3 m (10 ft) diameter fairing, 7.9 m (26 ft) fairing length.

Structural Loads

Preliminary limit load factors for the Delta II launch vehicle are given in Table D-1.

Table D-1
DELTA II
Limit Load Factor (G)
at Spacecraft C.G.

Axis	Liftoff		MECO
	Thrust	Lateral	
Lateral	± 2.0 $\pm 2.5^{(1)}$	± 2.0 $\pm 3.0^{(1)}$	-
Thrust	+2.4/-0.2 ⁽²⁾	+2.4/-0.2 ⁽²⁾	+6.0 \pm 0.6 ⁽³⁾

- (1) To provide correct bending moment at spacecraft separation plane, use lateral load factors of ± 2.5 for two stage and ± 3.0 for three stage Delta vehicles.
- (2) Plus indicates compression load.
- (3) This value, based on a three-stage mission with 1900-Kg (4200 lb) spacecraft, consists of a static component which is a function of spacecraft weight (see Figure D-1) and a dynamic component.

Examples of steady-state axial acceleration at MECO and third-stage burnout are given in Figures D-1 and D-2.

To avoid dynamic coupling between low-frequency vehicle and spacecraft modes, the stiffness of the spacecraft structure should be designed to produce fundamental frequencies above 35 Hz in the thrust axis and 15 Hz in the lateral axis for a spacecraft hard-mounted at the spacecraft separation plane (i.e., without payload attach fitting and separation clamp). The lateral fundamental frequency should be greater than 12 Hz if a two stage DELTA vehicle is used.

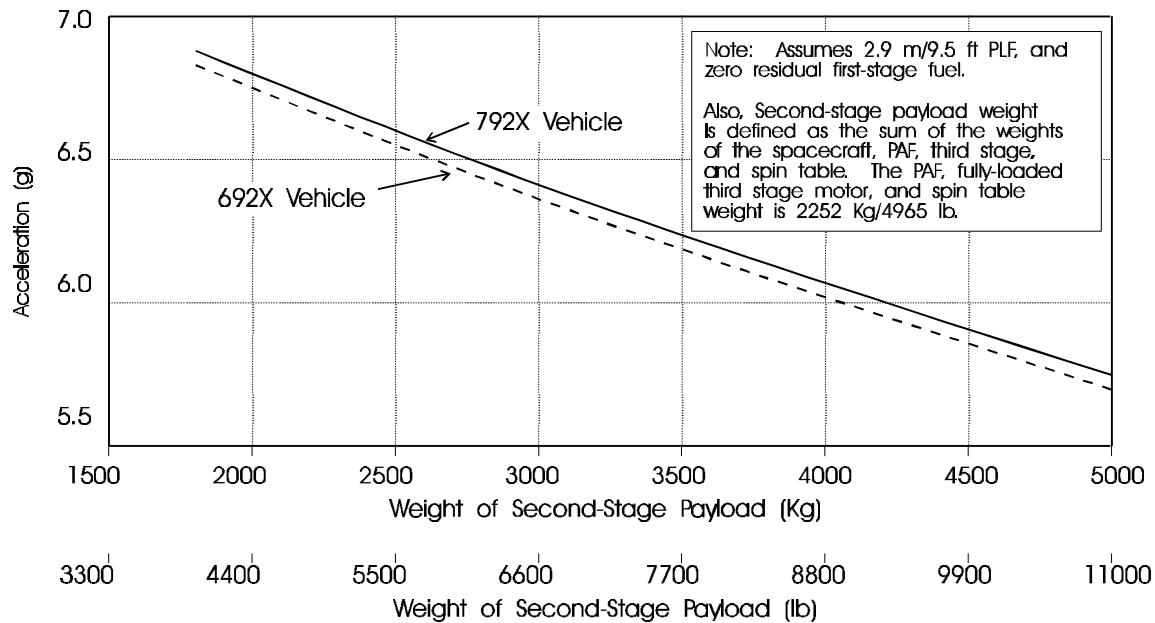

Figure D-1 DELTA II Axial Steady-State Acceleration at MECO Versus Second-Stage Payload Weight

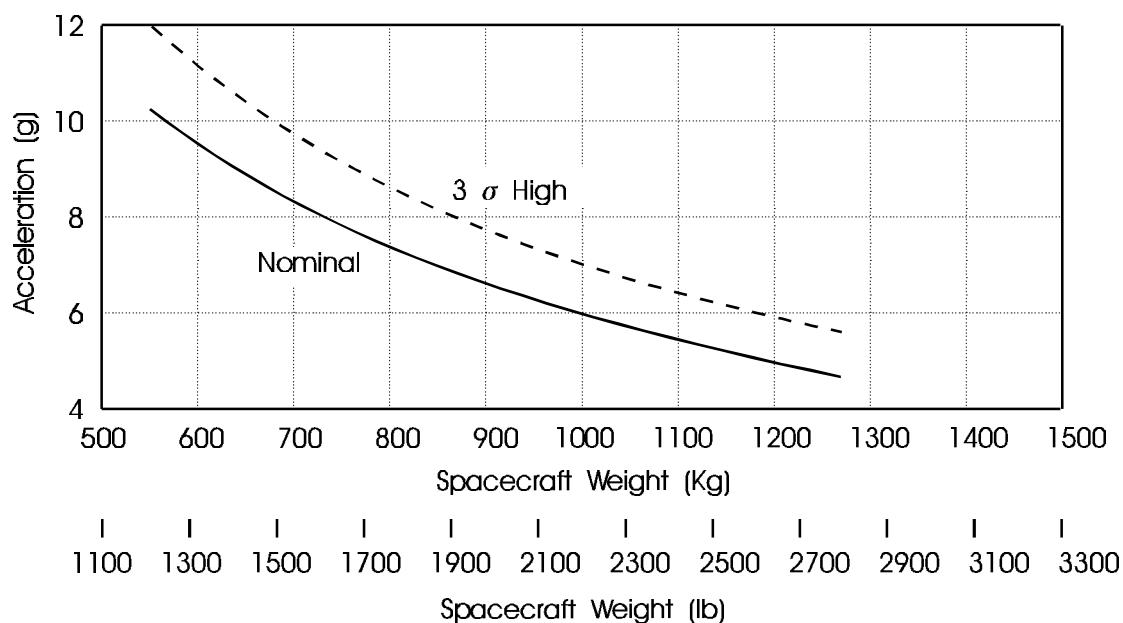

Figure D-2 DELTA II Axial Steady-State Acceleration at Third Stage Burnout

Acoustics

The qualification and acceptance acoustic test levels for a three stage Delta-II utilizing the 2.9 m (9.5-ft) and 3 m (10-ft) payload fairings are given in Tables D-2 and D-3 respectively. For a two stage Delta-II using a 3-m/10-ft payload fairing, the levels are the same as for the three stage version. For a three stage DELTA II utilizing the 2.4 m (8-ft) payload fairing, the acoustic test levels are given in Table D-4.

Spacecraft Random Vibration

The maximum expected random vibration levels (limit levels) at the spacecraft interface during Delta II launch are given in Table D-6.

Sine Vibration

The Delta user's guide provides the maximum expected levels given in Table D-7.

Mechanical Shock

The maximum expected separation shocks for the two and three stage Delta II vehicles are given in Tables D-7 and D-8.

Spacecraft Spin Balance

Refer to the Delta II Commercial Payload Planner's Guide, McDonnell Douglas Corporation, document MDC H3224B for the spacecraft spin balance requirements.
